These are my guesses as to what you are expecting of the javascript functions that we will later implement. Please keep in mind it is much harder to try and come up with a flow chart, and in my opinion bad practice, before you have written the js. You could change your mind on how you wanted something to work half way through implementation, which would require updates to the flowchart. Instead, why not just write the js, get it working and to your liking, then write the flowchart?

```
Start
  │
  ▼
Local Variables
  │
  ▼
getAccounts Function
  │
  ▼
storeData Function
  │
  ▼
getData Function
  │
  ▼
Finish
```

```
getAccounts Function ◄── Arguments Array
  │
  ▼
For Loop ──True──► Math
  │                  │
False                ▼
  │               Return Array
  ▼
Output
```

```
storeData Function
  │
  ▼
Object Form Field Data
  │
  ▼
Local Storage ──► Output
```

```
getData Function
  │
  ▼
For Loop ──True──► Math
  │                  │
False                ▼
  │               For In Loop ──True──► Math
  ▼                  │                    │
Output            False                   ▼
                     ▼                 Return String
                  Return Object
                                       Output
```

Project 1 Flow Chart
